JOSÉ GREGORIO GALVIS RIVAS

Chief Technology Officer · Fintech & Web3 · Mobile (Flutter)

jose.galvis.rivas@gmail.com Caracas, Venezuela (remote) linkedin.com/in/josegalvisrivas github.com/josegalvis27

SUMMARY

Computer Engineer and CTO of Coco Wallet and Coco Mercado, a self-custodial wallet with 190,000+ registered users, US$75M+ in cumulative processed volume and fiat on/off-ramps across 9 markets in the Americas and Europe. I own architecture, mobile, payments, security and releases, leading a team of 3 engineers and 3 QA. As part of the team, I helped scale monthly operations 4× in two years while cutting RPC infrastructure cost by 75%. I moved the wallet from seed phrases to MPC/TSS and to gasless account abstraction (ERC-4337), integrated 10+ payment and KYC providers, and built an AI-agent engineering process from spec to E2E. Co-founder of Staff On.

WORK EXPERIENCE

Chief Technology Officer — Tech Lead and Mobile Engineer **2022 – present**
Coco Market Inc. — Coco Wallet & Coco Mercado Remote, Venezuela

Self-custodial wallet with on/off-ramps in Venezuela, Colombia, Argentina, Peru, Mexico, Brazil, the United States, Canada and the European Union.

Growth and scale

- As part of the team, scaled the platform through 4× growth in two years: from ~10,000 to ~40,000 monthly operations and from 1,650 to 4,700 monthly transacting users.
- 190,000+ registered users, ~1,800 daily operations and US$75M+ in processed volume across ~800,000 completed operations (cumulative).

Web3 and blockchain infrastructure

- Led the migration of 3,500+ funded users from seed-phrase wallets to MPC/TSS with zero loss of funds.
- Shipped account abstraction (ERC-4337) with a paymaster and gasless transactions on Polygon, Optimism, Base, BNB Chain and Celo.
- Cut gas per sponsored transaction by 64% through dynamic bundler estimation, validated on-chain.
- Found that ~83% of observed send failures (25 of 30 in a production sample) shared one root cause, the UserOp nonce, and removed it by moving nonce handling client-side.
- Cut RPC spend by 75% (US$80 to US$20 per day, ~US$22K per year) after diagnosing a miscalibrated deposit monitor.

Payments and product

- Integrated 10+ ramp and KYC providers: Bridge (USD, EUR, MXN, BRL, COP), Ripio (AR, CO, MX), Venezuelan Pago Móvil through 3 providers, Bizum, Zelle, PayPal, Stripe, Ramp and Sumsub.
- Built Millo, an on-chain lottery mini app on Base paid in USDC, and Rumbo, a travel mini app with USDC checkout.

Security

- Contained a ~63,000-request attack: forensics, WAF blocking, closing the exploited vectors and an internal blocking tool.
- Added chain and currency guards to withdrawals after an incident where funds were sent to the wrong network.

Leadership and delivery

- Lead 3 engineers and 3 QA plus interns; mentored 3 people into the team.
- Set the roadmap with Product, own go/no-go release decisions and manage store publishing.
- Authored 500+ merged PRs (44% of the repository) and 39 epics; the team closed ~1,500 QA tickets.

Mobile development with Flutter

- Defined the app architecture: feature-based Clean Architecture (34 modules), Provider and BLoC, GetIt injection, dev/prod flavors and an in-house token-based design system.
- Built the quality baseline: 245 unit, widget and golden test suites (with CI tolerance) and 44 Maestro E2E flows.
- Integrated native and third-party SDKs: Particle (MPC), Sumsub, Ramp, Kustomer, Firebase (FCM, Remote Config, Analytics), Sentry and ML Kit for OCR data capture.
- Built key screens: the new Home, a coach-mark onboarding tutorial, forced update, single-screen Pago Móvil and transaction receipts.
- Ship to the App Store and Google Play and resolved review rejections: purpose strings, ATT and the iPad OTP layout.
- Fixed a release-only iOS crash caused by duplicated native dependencies (SnapKit/SwiftyJSON) across static and dynamic linking.

CI/CD and AI engineering

- Built the GitHub Actions pipelines that build, sign and deliver the Android APK and iOS IPA to QA on every merge, regenerate golden tests and monitor iOS credential expiry.
- Designed a 10-agent implementation graph that takes a feature from spec to green tests and E2E, with adversarial audits.
- Built an agent "office" (planning, development, QA, code review, security, support, release) with human approval gates; adopted by product marketing.
- Built a video pipeline using real app screens and a cloned voice: 4K tutorials for 10 countries.

Stack: Flutter/Dart, Node.js, AWS Lambda/Serverless, MongoDB, EVM, ERC-4337, MPC/TSS, Alchemy, Particle, Firebase, Sentry, PostHog, GitHub Actions, Maestro, Claude Code, MCP.

Co-founder **2026 – present**
Staff On — staffon.app Caracas, Venezuela

- Co-founded a marketplace that connects companies with temporary talent for events: Flutter app, Node.js/Express API and web dashboard.
- Built shifts, automatic contracts, two-part verified payments, ratings and BCV exchange-rate support; set up the agent office and Maestro E2E flows.

Full Stack Web Developer **04/2022 – 08/2022**
Social Oplesk Remote, Venezuela

- Built web applications with React, Node.js and MongoDB.
- 1st place, Telegram chatbot hackathon; 2nd place, crypto wallet hackathon (July 2022).

Programming Teaching Assistant **03/2019 – 12/2021**
School of Engineering — Universidad Central de Venezuela Caracas, Venezuela

- Taught programming labs and tutoring sessions to student groups for nearly 3 years.

EDUCATION

B.S. in Computer Engineering **Completed · graduation 11/2026**
Universidad Alejandro de Humboldt Caracas, Venezuela

Diploma in Web3 and Blockchain Development **11/2024 – present**
Universidad Católica Andrés Bello Caracas, Venezuela

SKILLS

Leadership

- Engineering and QA team management
- Roadmap with Product and release decisions
- App Store and Google Play publishing
- Security incident response
- Mentoring and team development
- Scrum

Technical

- Mobile: Flutter/Dart, Clean Architecture, Provider/BLoC, GetIt, design systems, iOS/Android builds
- Backend and cloud: Node.js, AWS Lambda, WAF, CloudWatch, MongoDB, Python
- Web3: EVM, ERC-4337, MPC/TSS, Alchemy, Particle
- Payments: on/off-ramps, KYC (Sumsub), Bridge, Ripio, Stripe, Ramp
- Quality: unit, widget and golden tests; Maestro E2E; CI
- Observability: Sentry, PostHog, GA4
- Applied AI: Claude Code, agents, skills, MCP
- Web: React, Next.js, JavaScript, HTML/CSS
- Languages: Spanish (native), English (B1, improving)
